Report

There are few webpages that we redesigned and also several new webpages that we created. First of all, we created a login webpage for both student users and instructor users. In the login webpage, we added a signup button that new users can be directly sent to the signup page to create a new account. We then created an error page for the users who fail to enter a correct username or password by showing them "incorrect username" or "incorrect password" depending on which part that the user entered was wrong. We added a logout button on the top right corner on each page for the users to sign out. We redesigned the anonymous feedback page for student users by giving four text boxes that they can write feedbacks instead of showing them the already existed feedbacks. We also created a selection button for student users to choose which instructor they want to leave a feedback to. For the student users, we created a grade page for them to check all the grades in one row and at the bottom of the grade page, student users can choose which project they want to submit a remark request as well as the reason. We also added a button for student users to confirm that he/she wants to submit the request after they clicking the submit button for remark request. For instructor users, there is a page for them to check their own feedbacks and a page for them to check the grades of all of his/her students. The instructor users are able to edit their students' grades by easily entering new mark, student id and selecting the project at the bottom of the grades page. After the instructors click the submit button for regrading, we added a button for them to confirm the modification as well. Also, there is a new page for instructor users to check all the remark requests submitted by their students.

One feature that we think is imperfect is that when there's a student submitting a remark request, every instructors and TAs will receive that request.

For the assignment 3, Du Han was in charge of flask, most of the flask parts was done by Du Han. Yanjia Gong was in charge of the html and css for instructor parts and the flask parts that related to the the instructor parts and student parts. Yujie Li was in charge of the database, the report, the html and css for student parts and helped with some of the flask parts for student parts. The workload was 33.3%, 33.3% and 33.3% respectively.
